

SAMPLE REVIEW PACKAGE

A decision you can follow. A correction plan you can use.

Pine Ridge Trails / illustrative build 1.8 (42). Policy context: Google Play. Example materials cover the listing, account flow, and privacy declaration.

EXAMPLE RECOMMENDATION

Fix before submission.

Three documented discrepancies need action. Every proposed correction below awaits implementation and recheck evidence. No real client build was tested for this sample.

THE HANDOFF

01 / Store listing

Make the promise match the product.

Owner: Developer / listing owner | Status: Awaiting implementation / not rechecked.

02 / Account flow

Turn an account dead end into a clear exit.

Owner: Developer / account-service owner | Status: Awaiting implementation / not rechecked.

03 / Privacy answers

Replace a blanket answer with traceable evidence.

Owner: Developer / data-handling owner | Status: Awaiting implementation / not rechecked.

HOW TO USE THIS PACKAGE

Read the observation and reproduce the path. Implement the specific correction. Supply the evidence needed for the acceptance checks. A focused recheck assesses the originally flagged item within the written scope.

A real report records the actual build, test environment, evidence capture references, severity rationale, recommendation, and untested areas. This fictional package demonstrates that structure; it does not certify a product.

Official source references checked September 7, 2026. The accompanying Markdown report and CSV correction checklist contain the same three findings.

FINDING 01 / STORE LISTING

Make the promise match the product.

RECOMMENDATION: FIX BEFORE SUBMISSION / ILLUSTRATIVE

RECORDED OBSERVATION

In this fictional build 1.8 (42), Trails opens Sunset Loop. The supplied discovery screenshot cannot be reproduced in that inspected path.

WORK BEHIND THE FINDING

Open the exact build with the supplied account, navigate to Trails, record the reachable screen, and compare it with listing image 02.

REPRODUCTION PATH

Sign in > Trails > Sunset Loop; compare with listing image 02.

Evidence: E-01 / supplied listing image 02; E-02 / build 1.8 (42), Trails screen

CORRECTION PLAN

- Replace image 02 with a capture from the submission build.
- Describe the saved route, distance, elevation, and difficulty shown.
- Compare the entire final screenshot sequence with the same build.

ACCEPTANCE CHECKS

- Image and caption match the current screen.
- Reviewer access reaches the pictured flow.
- No discovery claim remains without supporting behavior.

Owner: Developer / listing owner | Recheck: Awaiting implementation / not rechecked.

BASIS AND BOUNDARY

Store listings must accurately represent the app. The visual treatment shown here is a design recommendation.

Google Play: Deceptive behavior

This illustrates a listing correction. AppShield recommends the changes; the customer implements them. No new app feature or store approval is implied.

FINDING 02 / ACCOUNT FLOW

Turn an account dead end into a clear exit.

RECOMMENDATION: FIX BEFORE SUBMISSION / ILLUSTRATIVE

RECORDED OBSERVATION

The fictional Account screen ends at Sign out. Help & support is generic, and the supplied deletion-link field is blank.

WORK BEHIND THE FINDING

Create or enter the test account, inspect Account, follow Help & support, and record the missing request path and the supplied deletion-link field.

REPRODUCTION PATH

Profile > Account > Help & support; inspect supplied deletion URL.

Evidence: E-01 / Account screen; E-02 / Help & support destination; E-03 / deletion-link field, blank

CORRECTION PLAN

- Add a prominent Delete account entry and a functioning request path.
- Explain affected data, actual timing, and applicable retention before confirmation.
- Publish the app-named web deletion resource and supply its link for the Google Play submission.

ACCEPTANCE CHECKS

- Request path is reachable using the test account.
- Web request resource works without reinstalling the app.
- UI wording matches owner-supplied process details; unverified backend erasure stays marked unverified.

Owner: Developer / account-service owner | Recheck: Awaiting implementation / not rechecked.

BASIS AND BOUNDARY

For applicable Google Play apps with account creation, both an in-app deletion path and a web request resource are required.

Google Play: Account deletion

The illustrated screens are a proposed interface. A request acknowledgment does not prove backend erasure; that remains outside this review without separate evidence.

FINDING 03 / PRIVACY ANSWERS

Replace a blanket answer with traceable evidence.

RECOMMENDATION: FIX BEFORE SUBMISSION / ILLUSTRATIVE

RECORDED OBSERVATION

The fictional draft says No data collected. E-03 shows trail_opened and demo-7f2a sent to analytics.example; the inventory includes an analytics component.

WORK BEHIND THE FINDING

Compare the declaration with the supplied SDK inventory and test event. Record the contradiction, then ask the implementation owner for facts the client evidence cannot establish.

REPRODUCTION PATH

Declaration draft > SDK inventory > supplied test event > owner questions.

Evidence: E-01 / declaration draft; E-02 / SDK inventory; E-03 / illustrative test event

CORRECTION PLAN

- List the observed identifiers, activity, and included SDK.
- Obtain evidence for collection purposes, recipient roles, sharing, retention, and optionality.
- Update declaration and privacy information together; leave unresolved answers explicitly open.

ACCEPTANCE CHECKS

- Each revised answer cites supporting evidence.
- The third-party component is included in the assessment.
- Owner questions are resolved or recorded as not evaluated; no unknown is counted as a pass.

Owner: Developer / data-handling owner | Recheck: Awaiting implementation / not rechecked.

BASIS AND BOUNDARY

Google Play asks developers to account for data handled by the app and included third-party components.

Google Play: Data safety

The proposed register is not a completed declaration or full privacy audit. Client evidence alone does not establish server-side handling.
